Type of correlation

pearson

i Correlation measures may be unreliable when the proportion of missing is large!

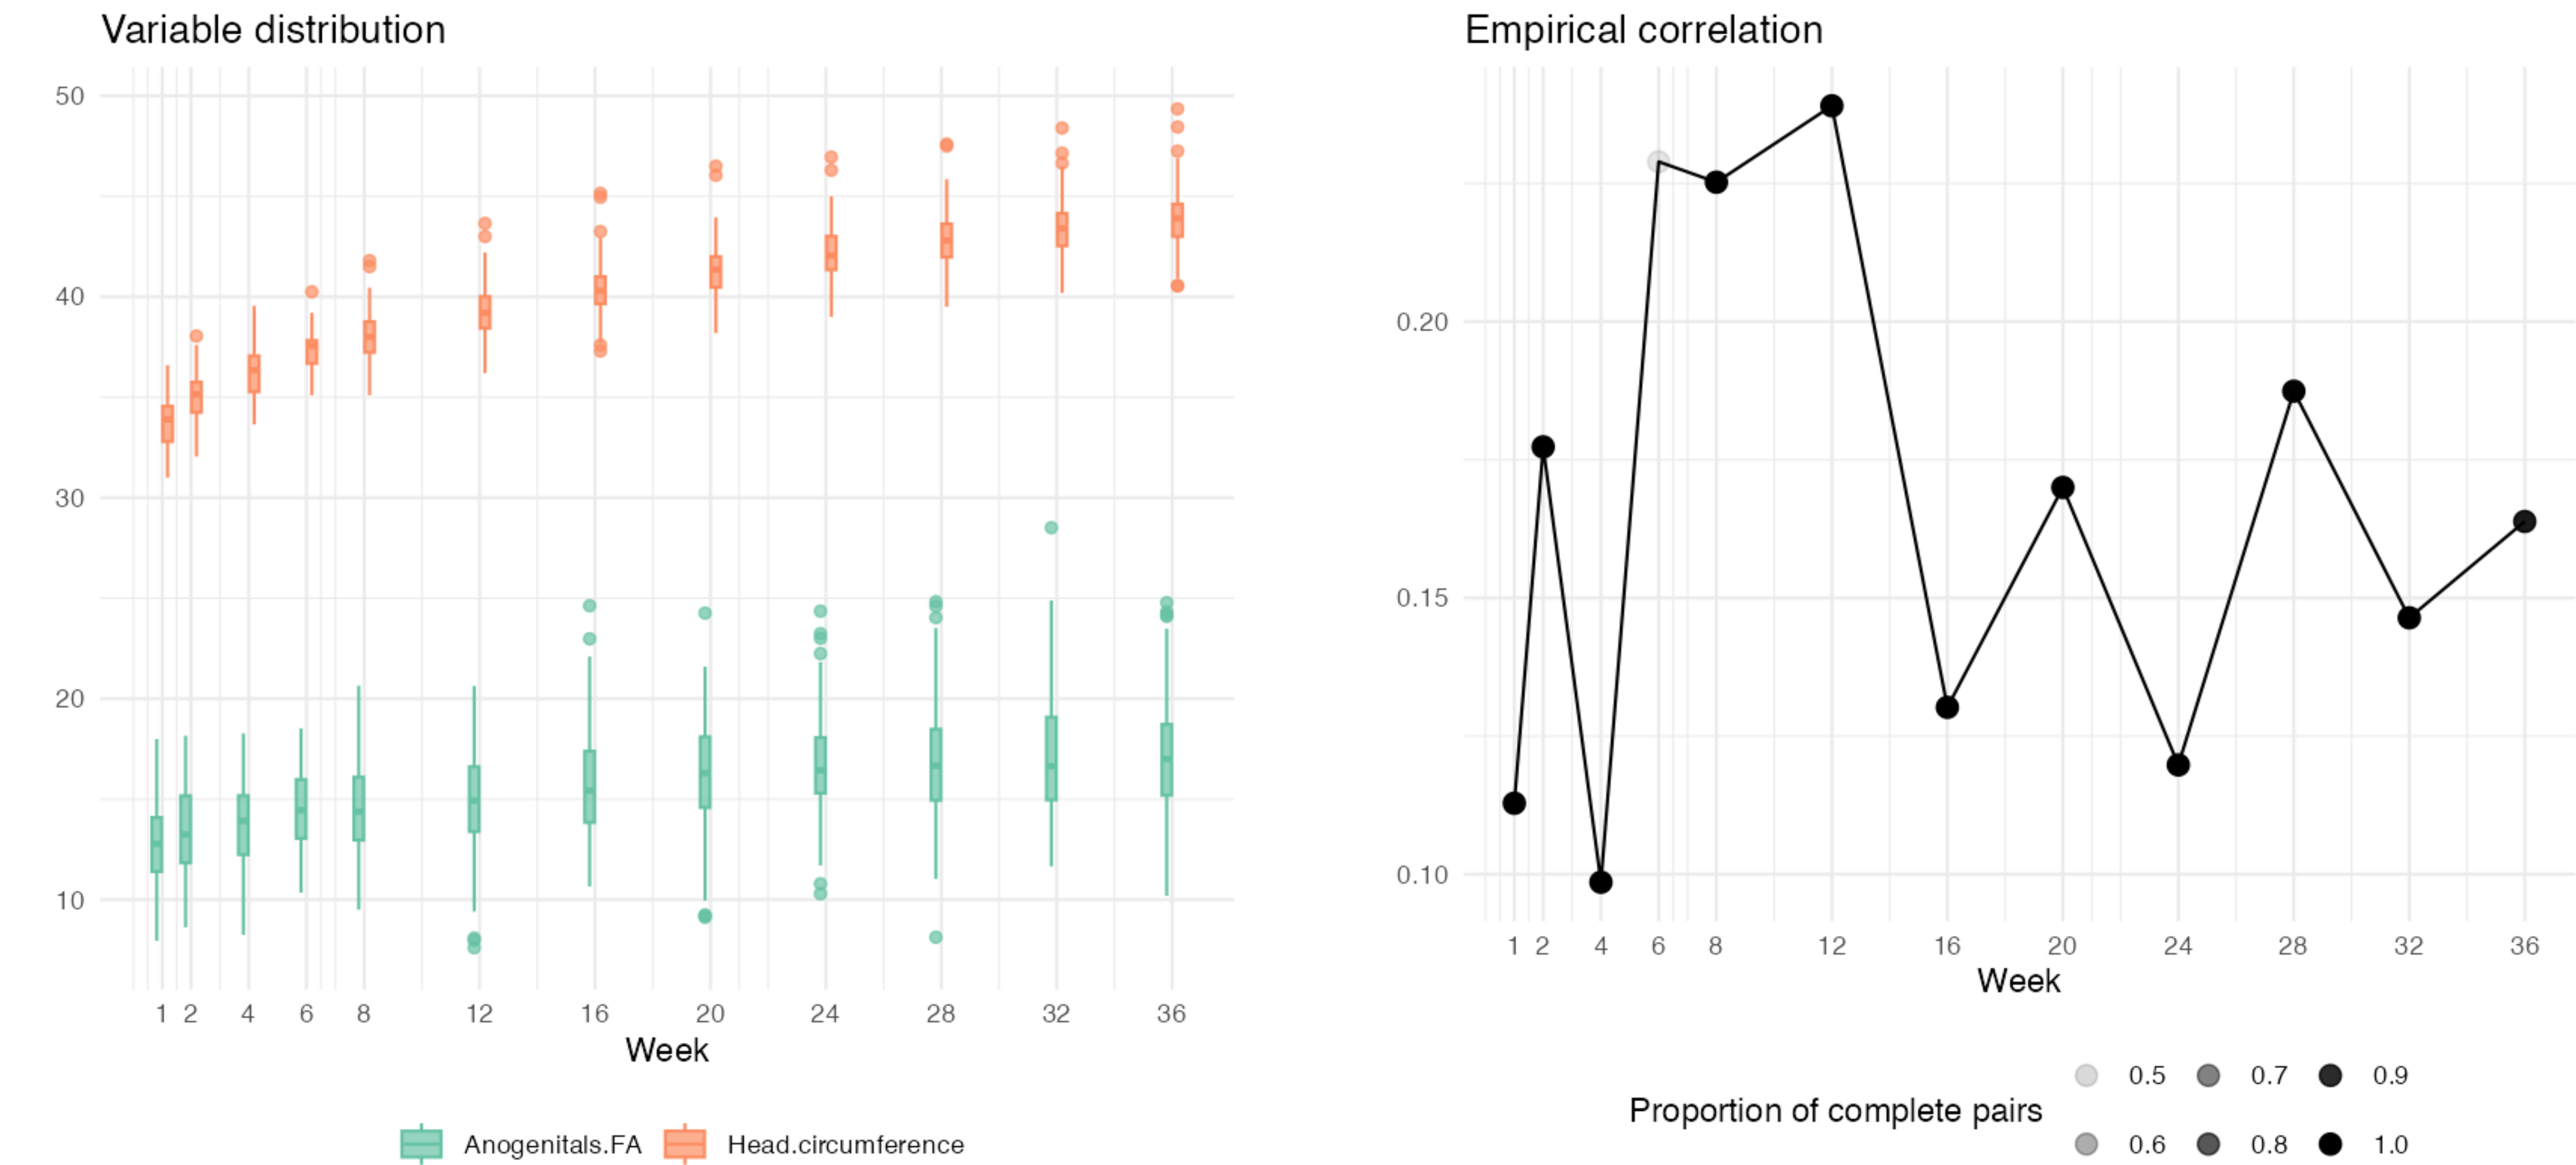

Variables

- ☐ ID
- ☐ Week
- ☒ Head.circumference
- ☒ Anogenitals.FA
- ☐ Anogenitals.anterior
- ☐ Bud.bead.size
- ☐ BMI.for.age
- ☐ FSH
- ☐ Estradiol_N
- ☐ Testosterone
- ☐ Ovary.volume
- ☐ Bud.bead.volume
- ☐ Thyroid.volume
- ☐ Uterus.volume

☒ Scale correlation axis to data?

i Scaled axis's range is determined by the observed correlation, which is better for observing the change the correlation. Unscaled axis's range is fixed to [-1, 1], which is better for observing the magnitude of correlation.

Comparision of distribution, temporal trend and empirical correlation

i Correlation measures are very sensitive to sample size. If the number of complete pairs is very small (i.e < 10), the calculated measures are less realiable and will affect downstream analysis. User may consider removing these time points from the dataset. When the number of complete pairs is less then 10, the correlation is removed from visualization. Details of these time points can be examined in the previous subtab.
